Theory

Mackey model

Particles:

3+1 Galilei  
3+1 Poincare  
2+1 Galilei  
n+1 Galilei  
GR

References

## Outline:

- Brief introduction to the Mackey-model.
- Some results for the Galilei and the Poincare relativity.
- Problems with the general relativity in this model.

Mackey model

## The Mackey model

This model is about Quantum *mechanics*.

(Not about electromagnetic fields, not about interactions.)

Arguments for and against this model:

*Against:*

- Just about mechanics.
- Not about interactions of particles.
- One can argue against the axioms of the model.

*For:*

- Mathematically exact.
- Everything is based on axioms and theorems.
- Uses simple axioms.
- Very powerful tool.

The general Mackey-model:  $\langle F, G, L, Q, T, \mathcal{M} \rangle$

- $F$  the set of *events*, (problem for physicists)
- $G$  transformation group (Galilei or Poincare group), such that  $\forall g \in G$  there exists a

$$g : F \rightarrow F \quad E \mapsto gE$$

- $L$  Hilbert space of states (problem for physicists)
- $Q : G \rightarrow \text{Aut}(L)$  representation of the group  $G$ , such that

$$Q_g(T(E)) = T(gE) \quad \forall E \in F, \forall g \in G$$

holds,

- $\mathcal{M}$  set of probability distributions on  $L$ , (*state space*).

# Elementary Particles

Widely believed physical interpretation:

Elementary particles.  $\iff$  Irreducible Representations.

I. Simplification: ( $G$  must be a Lie-group)

Projective Representations.  $\iff$  Unitary Representations.

Proj. Repr. of  $G \iff$  Unit. Repr. of  $(\tilde{G})_{i \in I}$

II. Theory of Induced Unitary Representation:

Universal method to get every irreducible (continuous unitary) representation of *all locally compact* group.

## The Galilei group:

–  $\mathcal{G}_n = \mathbb{R} \times \mathbb{R}^n \times \mathbb{R}^n \times SO(n)$  as a set,  
the multiplication rule is

$$(t_1, x_1, v_1, R_1)(t_2, x_2, v_2, R_2) = \\ (t_1 + t_2, x_1 + R_1 x_2 + v_1 t_2, v_1 + R_1 v_2, R_1 R_2).$$

– The Mackey model is  $(t, x, v, R)$

$$(t, x, v, R) : \mathbb{R} \times \mathbb{R}^n \rightarrow \mathbb{R} \times \mathbb{R}^n \quad (\tau, \xi) \mapsto (t + \tau, A\xi + tv + x).$$

– The topology comes from the topology of  $\mathbb{R}^m$ .

$\mathcal{G}_n$  is a Lie group.

## Projective Representation of the $2 + 1$ Galilei group

### I. Simplification:

$$\begin{array}{c} \text{Proj. Repr. of } \mathcal{G}_2. \\ \uparrow \\ \text{Unit. Repr. of } (\tilde{\mathcal{G}}_{2,m,f,j})_{m,f,j \in [0, \infty[}. \end{array}$$

### II. Theory of Induced Unitary Representation:

The unitary representations of the group  $\tilde{\mathcal{G}}_{2,m,f,j}$  gives many elementary particles.

## List of the particles:

- (a) The particles with  $m \neq 0, j = 0$ , can be characterized by  $\rho \in \mathbb{R}, n_0 \in \mathbb{Z} \setminus \{0\}, n_2 \in \mathbb{Z}$ .
- (b) The particles with  $m = 0, j \neq 0$ , can be characterized by  $n_0 \in \mathbb{Z} \setminus \{0\}, n_2 \in \mathbb{Z}$ .
- (c) The particles with  $m = 0, j \neq 0$ , can be characterized by  $\rho \in ]0, \infty[, n_0, n_2 \in \mathbb{Z}$ .
- (d) The particles with  $m = 0, j = 0$ , can be characterized by  $\rho \in \mathbb{R}, n_0, n_2 \in \mathbb{Z}$ .
- (e) The particles with  $m = 0, j = 0$ , can be characterized by  $\rho \in ]0, \infty[, n_0, n_2 \in \mathbb{Z}$ .
- (f) The particles with  $m \neq 0, j \neq 0$ , can be characterized by  $n_0, n_2 \in \mathbb{Z} \setminus \{0\}$ .

Deeper analysis:  $f$ : something like "magnetic force".

## List of the particles:

- (a) The particles with  $m \neq 0, j = 0$ , can be characterized by  $\rho \in \mathbb{R}, n_0 \in \mathbb{Z} \setminus \{0\}, n_2 \in \mathbb{Z}$ .
- (b) The particles with  $m = 0, j \neq 0$ , can be characterized by  $n_0 \in \mathbb{Z} \setminus \{0\}, n_2 \in \mathbb{Z}$ .
- (c) The particles with  $m = 0, j \neq 0$ , can be characterized by  $\rho \in ]0, \infty[, n_0, n_2 \in \mathbb{Z}$ .
- (d) The particles with  $m = 0, j = 0$ , can be characterized by  $\rho \in \mathbb{R}, n_0, n_2 \in \mathbb{Z}$ .
- (e) The particles with  $m = 0, j = 0$ , can be characterized by  $\rho \in ]0, \infty[, n_0, n_2 \in \mathbb{Z}$ .
- (f) The particles with  $m \neq 0, j \neq 0$ , can be characterized by  $n_0, n_2 \in \mathbb{Z} \setminus \{0\}$ .

Deeper analysis:  $f$ : something like ”magnetic force”.

# Projective Representation of the $n + 1$ Galilei group

I. Simplification:  
Theorem [Andai]:

$$\begin{array}{c} \text{Proj. Repr. of } \mathcal{G}_n. \\ \uparrow \\ \text{Unit. Repr. of } (\tilde{\mathcal{G}}_{n,m})_{m \in ]0, \infty[} \end{array}$$

II. Theory of Induced Unitary Representation:  
Future plan.

## Towards General Relativity

In this case  $G$  is the diffeomorphism group of the space-time.

Then  $G$  is an infinite dimensional Lie group.

### I. Simplification:

This step maybe could be done, but the result is unknown.

### II. Theory of Induced Unitary Representation:

Since  $G$  is *not* locally compact, this is still problem for mathematicians!
