# Broad Classification of

# Each Region Has a Specific

**Spinal Cord** - Sensory & motor information and control of reflexes

**Brainstem** - Information gateway between body and brain, integrative functions (cardiovascular, respiratory, and pain-sensitivity control and also consciousness)

**Cerebellum** - Motor Control, Attention & Language etc.

**Diencephalon (Thalamus)** - Inputs to cortex

**Diencephalon (Hypo-Thalamus)** - Control of endocrine system (hormones)

**Prosencephalon (Hippocampus)** - Learning, long term consolidation

**Prosencephalon (Cortex)** - Higher cognitive functions

Cell Body (Soma) - Contains DNA, cell nucleus

Dendrite - Brings input to the neuron

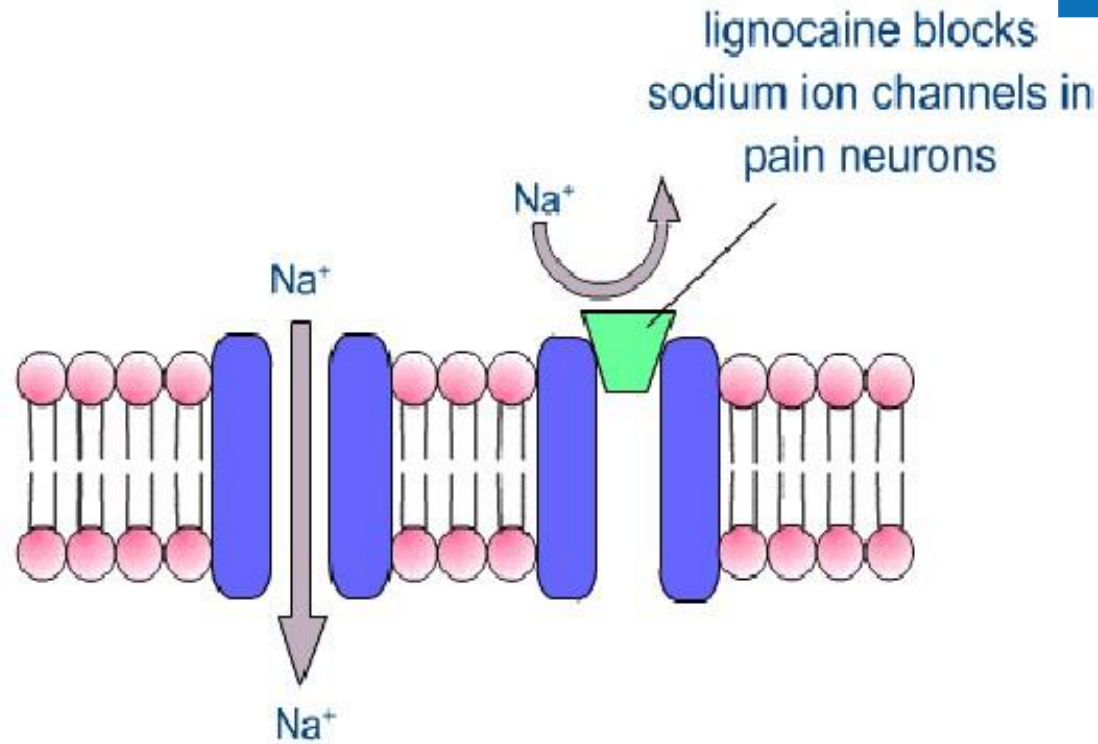

Axon - The output of a neuron

Synapse - Transfer the information from one cell to another

# Ion Channels

Physiological Specialization - Membrane spanning ion channels

Allow ions to move in and out of cell

Work by opening and closing in response to voltage changes

Most prominent being  $\text{Na}^+$ ,  $\text{K}^+$ ,  $\text{Ca}^{2+}$ ,  $\text{Cl}^-$

# Spikes - Units of Information

If a neuron is **depolarized** sufficiently to raise the **membrane potential** above a threshold level, a **spike or action potential** is generated

Roughly 100 mV fluctuation, lasts for ~ 1ms

Of great importance, as spikes can **propagate over large distances**

A spike causes a neuron to go into **refractory period**

$$p(z_1, \dots, z_k)$$

Joint distr. of  $k$  binary variables.

# How to store/represent and sample a distribution?

$$p(z_1, \dots, z_k)$$

Joint distr. of  $k$  binary variables.

We construct a network  $\mathcal{N}$  of  $k$  spiking neurons  $v_i$   $i=1, \dots, k$  which produce sample from  $p$ .

The firing of  $\mathcal{N}$  will be a non-reversible MC.

unit

Spike/action potential  $s_i$  with 1 ms duration

Influence on itself and other neurons  
last 5-100 ms – refractory period

Time is discretized. Unit is small, an integer time constant  
 $\tau$  is defined multiple of that unit.

# Neural representation

Spike/action potential  $s_i$  with 1 ms duration

Influence on itself and other neurons  
 last 5-100 ms – refractory period

Time is discretized. Unit is small, an integer time constant  $\tau$  is defined multiple of that unit.

$$z_i(t) = 1 \Leftrightarrow s_i \text{ fired in } t \in (t - \tau, t]$$

i.e. The rv is set to 1 for duration of  $\tau$ , for the refractory period of the neuron.

# Neural representation

The Markovity needs the bookkeeping of the times:

We define

$$(\zeta_1, \dots, \zeta_k) \in (\mathbb{R}^+)^k$$

for each  $i$   $\zeta_i$  denote the time when the neuron spike  
whitin the interval,

# Neural representation

The Markovity needs the bookkeeping of the times:

We define

$$(\zeta_1, \dots, \zeta_k) \in (R^+)^k$$

for each  $i$   $\zeta_i$  denote the time when the neuron spike  
whitin the interval,

$$(t - \tau, t]$$

and setting  $z_i = 1$  at time  $t$ .

# Neural representation

The Markovity needs the bookkeeping of the times:

We define

$$(\zeta_1, \dots, \zeta_k) \in (\mathbb{R}^+)^k$$

for each  $i$   $\zeta_i$  denote the time when the neuron spike  
whitin the interval,

$$(t - \tau, t]$$

and setting  $z_i = 1$  at time  $t$ .

$\zeta_i$  time count down: at the spike, the *variable*  $\zeta_i$  is set  
to  $\tau$  then decreasing linearly above 0.

$$p(z_j = 0 \mid \zeta_j = 0) = 1$$

$$p(z_j \mid \zeta_j) = 0 \quad \text{In all other cases}$$

# MC in discrete time

the deterministic and random transition of  $\zeta, z$

# MC in discrete time

*The dynamic is defined by the map  $T$  which is simply*

$$T = T^k \circ T^{k-1} \circ \dots \circ T^1$$

*that is, the neuron states updated in a fixed order and at the current step, the membrane potential is based on the state of the updated or non-updated union of the set  $\setminus i$  furthermore the new state  $\zeta_i$  depends on the previous  $\zeta_i^{prec}$ .*

1.  $T^i$  leaves invariant  $p(\zeta, z)$ ,
2. Any combination, and  $T$  as well does.
3.  $T$  defines an aperiodic, irreducible MC has unique invariant distribution
4.  $p(\zeta, z)$  the unique invariant distribution.
5.  $p(z)$  can be sampled via  $p(\zeta, z)$  using the MC.

1. relative refractory state
2. continuous time
3. other distributions

# Extensions

## 1. relative refractory state

the readiness function  $g$  is introduced, the sigmoid should be replaced by a proper function  $f$  satisfying:

$$\exp(u) = f(u) \frac{\sum_{t=1}^{\tau} \prod_{s=t+1}^{\tau} (1 - g(s)f(u))}{\prod_{s=1}^{\tau} (1 - g(s)f(u))}$$

Remark. The pd is approximated only.
