Name:
Neptun-code:

1. (10p) Solve the following differential equation: $y^{\prime}=\frac{y}{x}+\frac{y^{2}}{x^{2}}$.
2. $(10 \mathrm{p})$ Solve the following differential equation: $y^{\prime}=\frac{x^{3}-2 y}{x}$.
3. (10p) Solve the following initial value problem:

$$
2 y^{2} y^{\prime \prime}=\left(y^{\prime}\right)^{3}, y(0)=1, y^{\prime}(0)=2 .
$$

4. (10p) If we throw a die six times what is the probability that we will have at least one six?
5. (10p) Provided that we obtain exactly two heads after flipping a fair coin three times, what is the probability that the first flip was head?
6. (10p) The lifetime of an automobile battery follows exponential distribution with mean 3 years.
(a) Calculate the probability that the lifetime will be between 2 and 4 years.
(b) If the battery has lasted for 3 years, what is the probability that it will last for at least 2 additional years?
7. (10p) Suppose that the annual rainfall in Hungary is normally distributed with mean 600 mm and standard deviation 75 mm . Suppose that the annuall rainfalls are independent.
(a) What is the probability that the rainfall will be over 750 mm next year?
(b) On average, how many years do we have to wait for such a year?
8. (10p) Solve the following differential equation system:

$$
2 x^{\prime}-4 x+y^{\prime}-y=e^{t}, \quad x^{\prime}+3 x+y=0 .
$$

9. (10p) The number of requests a website receives in each second follows Poisson distribution with mean 1.3. The website crashes if it gets 120 or more requests in a single minute. Using the central limit theorem, estimate the probability that the server crashes in the next minute.
