Imre Péter Tóth
Homework sheet 3 – due on 25.10.2018

3.1 The characteristic function of a random variable X is the function $\Psi : \mathbb{R} \rightarrow \mathbb{C}$ defined as $\Psi(t) := \mathbb{E}e^{itX}$, which, of course, depends on the distribution of X only. Calculate the characteristic function of

- (a) The Bernoulli distribution $B(p)$
- (b) The “pessimistic geometric distribution with parameter p ” – that is, the distribution μ on $\{0, 1, 2, \dots\}$ with weights $\mu(\{k\}) = (1-p)p^k$ ($k = 0, 1, 2, \dots$).
- (c) The “optimistic geometric distribution with parameter p ” – that is, the distribution ν on $\{1, 2, 3, \dots\}$ with weights $\nu(\{k\}) = (1-p)p^{k-1}$ ($k = 1, 2, \dots$).
- (d) The Poisson distribution with parameter λ – that is, the distribution η on $\{0, 1, 2, \dots\}$ with weights $\eta(\{k\}) = e^{-\lambda} \frac{\lambda^k}{k!}$ ($k = 0, 1, 2, \dots$).
- (e) The exponential distribution with parameter λ – that is, the distribution on \mathbb{R} with density (w.r.t. Lebesgue measure)

$$f_\lambda(x) = \begin{cases} \lambda e^{-\lambda x}, & \text{if } x > 0 \\ 0, & \text{if not} \end{cases} .$$

3.2 Calculate the characteristic function of the normal distribution $\mathcal{N}(m, \sigma^2)$. (Remember the definition from the old times: $\mathcal{N}(m, \sigma^2)$ is the distribution on \mathbb{R} with density (w.r.t. Lebesgue measure)

$$f_{m, \sigma^2}(x) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(x-m)^2}{2\sigma^2}} .$$

You can save yourself some paperwork if you only do the calculation for $\mathcal{N}(0, 1)$ and reduce the general case to this using the relation between different normal distributions. You can and should use the fact that

$$\int_{-\infty}^{\infty} f_{m, \sigma^2}(x) dx = 1$$

for every m and σ .

3.3 *Dominated convergence and continuous differentiability of the characteristic function.*

The Lebesgue dominated convergence theorem is the following

Theorem 1 (dominated convergence) *Let $(\Omega, \mathcal{F}, \mu)$ be a measure space and f_1, f_2, \dots measurable real valued functions on Ω which converge to the limit function pointwise, μ -almost everywhere. (That is, $\lim_{n \rightarrow \infty} f_n(x) = f(x)$ for every $x \in \Omega$, except possibly for a set of x -es with μ -measure zero.) Assume furthermore that the f_n admit a common integrable dominating function: there exists a $g : \Omega \rightarrow \mathbb{R}$ such that $|f_n(x)| \leq g(x)$ for every $x \in \Omega$ and $n \in \mathbb{N}$, and $\int_\Omega g d\mu < \infty$. Then (all the f_n and also f are integrable and)*

$$\lim_{n \rightarrow \infty} \int_\Omega f_n d\mu = \int_\Omega f d\mu .$$

Use this theorem to prove the following

Theorem 2 (differentiability of the characteristic function) Let X be a real valued random variable, $\psi(t) = \mathbb{E}(e^{itX})$ its characteristic function and $n \in \mathbb{N}$. If the n -th moment of X exists and is finite (i.e. $\mathbb{E}(|X|^n) < \infty$), then ψ is n times continuously differentiable and

$$\psi^{(k)}(0) = i^k \mathbb{E}(X^k), \quad k = 0, 1, 2, \dots, n.$$

Write the proof in detail for $n = 1$. Don't forget about proving *continuous* differentiability – meaning that you also have to check that the derivative is continuous.

3.4 For real numbers a_1, a_2, a_3, \dots define the infinite product $\prod_{k=1}^{\infty} a_k$ as

$$\prod_{k=1}^{\infty} a_k := \lim_{n \rightarrow \infty} \prod_{k=1}^n a_k,$$

whenever this limit exists.

Let p_1, p_2, p_3, \dots satisfy $0 \leq p_k < 1$ for all k . Show that $\prod_{k=1}^{\infty} (1 - p_k) > 0$ if and only if

$$\sum_{k=1}^{\infty} p_k < \infty.$$

(Hint: estimate the logarithm of $(1 - p)$ with p .)

3.5 Let X_1, X_2, \dots, X_n be i.i.d. random variables with $\mathbb{E}X_1 = 0$ and $\mathbb{E}(X_1^4) < \infty$ and set $S_n = X_1 + \dots + X_n$. Show that there is a $C < \infty$ such that $\mathbb{E}(S_n^4) \leq Cn^2$.

3.6 (**homework**) Let X_1, X_2, \dots be independent random variables such that

$$\mathbb{P}(X_n = n^2 - 1) = \frac{1}{n^2}, \quad \mathbb{P}(X_n = -1) = 1 - \frac{1}{n^2}.$$

Show that $\mathbb{E}X_n = 0$ for every n , but

$$\lim_{n \rightarrow \infty} \frac{X_1 + \dots + X_n}{n} = -1$$

almost surely.

3.7 Let X_1, X_2, \dots, X_n be i.i.d. random variables. Prove that the following two statements are equivalent:

- (i) $\mathbb{E}|X_i| < \infty$.
- (ii) $\mathbb{P}(|X_n| > n \text{ for infinitely many } n\text{-s}) = 0$.

Hint: If Y is nonnegative integer valued, then $\mathbb{E}Y = \sum_{k=0}^{\infty} k\mathbb{P}(Y = k) = \sum_{n=1}^{\infty} \mathbb{P}(Y \geq n)$. (Why?)

3.8 Prove that for *any* sequence X_1, X_2, \dots of random variables (real valued, defined on the same probability space) there exists a sequence c_1, c_2, \dots of numbers such that

$$\frac{X_n}{c_n} \rightarrow 0 \text{ almost surely.}$$

3.9 Let the random variables $X_1, X_2, \dots, X_n, \dots$ and X be defined on the same probability space. Prove that the following two statements are equivalent:

- (i) $X_n \rightarrow X$ in probability as $n \rightarrow \infty$.

- (ii) From every subsequence $\{n_k\}_{k=1}^\infty$ a sub-subsequence $\{n_{k_j}\}_{j=1}^\infty$ can be chosen such that $X_{n_{k_j}} \rightarrow X$ almost surely as $j \rightarrow \infty$.

3.10 Let X_1, X_2, \dots be independent such that X_n has *Bernoulli*(p_n) distribution. Determine what property the sequence p_n has to satisfy so that

- (a) $X_n \rightarrow 0$ in probability as $n \rightarrow \infty$
 (b) $X_n \rightarrow 0$ almost surely as $n \rightarrow \infty$.

3.11 Let X_1, X_2, \dots be independent random variables. Show that $\mathbb{P}(\sup_n X_n < \infty) = 1$ if and only if there is some $A \in \mathbb{R}$ for which $\sum_{n=1}^\infty \mathbb{P}(X_n > A) < \infty$.

3.12 Let X_1, X_2, \dots be independent exponentially distributed random variables such that X_n has parameter λ_n . Let $S_n := \sum_{i=1}^n X_i$. Show that if $\sum_{n=1}^\infty \frac{1}{\lambda_n} = \infty$, then $S_n \rightarrow \infty$ almost surely, but if $\sum_{n=1}^\infty \frac{1}{\lambda_n} < \infty$, then $S_n \rightarrow S$ almost surely, where S is some random variable which is almost surely finite. (*Hint: the second part is easy. For the first part, a possible solution is to let x_i be such that $\mathbb{P}(X_i \geq x_i) = \frac{1}{2}$, $Y_i := x_i \mathbf{1}_{\{X_i \geq x_i\}}$, $Z_i := x_i - Y_i$ and use that $S_n \geq \sum_{i=1}^n Y_i$.)*

3.13 (**homework**) Let X_1, X_2, \dots be i.i.d. random variables with distribution *Bernoulli*(p) for some $p \in (0; 1)$ but $p \neq \frac{1}{2}$. Let $Y := \sum_{n=1}^\infty 2^{-n} X_n$. (The sum is absolutely convergent.) Show that the distribution ν of Y is continuous (meaning that the distribution function is continuous, which is the same as $\nu(\{x\}) = 0$ for any $x \in \mathbb{R}$), but singular w.r.t. Lebesgue measure (meaning that there is a set $A \subset \mathbb{R}$ such that $Leb(A) = 0$ and $\nu(\mathbb{R} \setminus A) = 0$).

(*Hint: Think of these random numbers as sequences of 0s and 1s in binary form. What will be the proportion of 0s and 1s?*)

3.14 Let the random variables $X_1, X_2, \dots, X_n, \dots$ and X be defined on the same probability space and suppose that $X_n \rightarrow X$ in probability as $n \rightarrow \infty$.

- (a) If $f : \mathbb{R} \rightarrow \mathbb{R}$ is a continuous function, $Y_n = f(X_n)$ and $Y = f(X)$, show that $Y_n \rightarrow Y$ in probability as $n \rightarrow \infty$.
 (b) Show that if the X_n are almost surely uniformly bounded [that is: there exists a constant $M < \infty$ such that $\mathbb{P}(\forall n \in \mathbb{N} |X_n| \leq M) = 1$], then $\lim_{n \rightarrow \infty} \mathbb{E}X_n = \mathbb{E}X$.
 (c) Show, through an example, that for the previous statement, the condition of boundedness is needed.

3.15 (**homework**) Let the random variables $X_1, X_2, \dots, Y_1, Y_2, \dots, X$ and Y be defined on the same probability space and assume that $X_n \rightarrow X$ and $Y_n \rightarrow Y$ in probability. Show that

- (a) $X_n Y_n \rightarrow XY$ in probability.
 (b) If almost surely $Y_n \neq 0$ and $Y \neq 0$, then $X_n/Y_n \rightarrow X/Y$ in probability.

3.16 (**homework**) Let the random variables $X_1, X_2, \dots, X_n, \dots$ be defined on the same probability space and let $Y_n := \sup_{m \geq n} |X_m|$. Prove that the following two statements are equivalent:

- (i) $X_n \rightarrow 0$ almost surely as $n \rightarrow \infty$.
 (ii) $Y_n \rightarrow 0$ in probability as $n \rightarrow \infty$.
