

**Probability 1**  
**CEU Budapest, fall semester 2018**  
Imre Péter Tóth  
**Homework sheet 5 – due on 26.11.2018**

5.1 Prove that

$$\lim_{n \rightarrow \infty} \int_0^1 \int_0^1 \dots \int_0^1 \frac{x_1^2 + x_2^2 + \dots + x_n^2}{x_1 + x_2 + \dots + x_n} dx_1 dx_2 \dots dx_n = \frac{2}{3}.$$

5.2 Let  $f : [0; 1] \rightarrow \mathbb{R}$  be a continuous function. Prove that

(a)

$$\lim_{n \rightarrow \infty} \int_0^1 \int_0^1 \dots \int_0^1 f\left(\frac{x_1 + x_2 + \dots + x_n}{n}\right) dx_1 dx_2 \dots dx_n = f\left(\frac{1}{2}\right).$$

(b)

$$\lim_{n \rightarrow \infty} \int_0^1 \int_0^1 \dots \int_0^1 f((x_1 x_2 \dots x_n)^{1/n}) dx_1 dx_2 \dots dx_n = f\left(\frac{1}{e}\right).$$

(Hint: interpret these integrals as expectations.)

5.3 (**homework**) Let  $X_n \sim \text{Bin}(n, \frac{2}{3})$ . Calculate  $\lim_{n \rightarrow \infty} \mathbb{E}\left(\sin\left(\left(\frac{X_n}{n}\right)^4\right)\right)$ .

5.4 *Poisson approximation of the binomial distribution.* Fix  $0 < \lambda \in \mathbb{R}$ . Show that if  $X_n$  has binomial distribution with parameters  $(n, p)$  such that  $np \rightarrow \lambda$  as  $n \rightarrow \infty$ , then  $X_n$  converges to  $\text{Poi}(\lambda)$  weakly. This can be done in a completely elementary way, using your favourite definition of weak convergence, or by using one of the stronger tools of weak convergence.

5.5 *Continuous limit of the geometric distribution.* Let  $X_n$  be geometrically distributed with parameter  $p_n = \frac{1}{n}$  and let  $Y_n = \frac{1}{n}X_n$ . (So  $\mathbb{E}Y_n = 1$ .) Find the weak limit of  $Y_n$ . (Hint: you can use the method of characteristic functions, but you can also calculate the limiting distribution function directly.)

5.6 *Continuous limit of the geometric distribution, general version.* Show that if  $0 \leq p_n \rightarrow 0$ ,  $0 \leq a_n \rightarrow 0$ ,  $\frac{p_n}{a_n} \rightarrow \lambda \in (0, \infty)$  and  $X_n \sim \text{Geom}(p_n)$ , then  $a_n X_n \Rightarrow \text{Exp}(\lambda)$ .

5.7 Let  $X$  be uniformly distributed on  $[-1; 1]$ , and set  $Y_n = nX$ .

a.) Calculate the characteristic function  $\psi_n$  of  $Y_n$ .

b.) Calculate the pointwise limit  $\lim_{n \rightarrow \infty} \psi_n(t)$ , if it exists.

c.) Does (the distribution of)  $Y_n$  have a weak limit?

d.) How come?

5.8 (**homework**) Show that if  $\Psi$  is the characteristic function of some random variable  $X$ , then the complex conjugate  $\bar{\Psi}$  is also the characteristic function of some random variable  $Y$ . (Hint: try to find out what  $Y$  is.)

5.9 Durrett [1], Exercise 3.3.1 (Hint: try to find the appropriate random variables. Use Exercise 8.)

5.10 Durrett [1], Exercise 3.3.3

5.11 Durrett [1], Exercise 3.3.9

5.12 Durrett [1], Exercise 3.3.10. Show also that independence is needed.

5.13 Durrett [1], Exercise 3.3.11

5.14 Durrett [1], Exercise 3.3.12

5.15 Durrett [1], Exercise 3.3.13

5.16 Let  $X_1, X_2, \dots$  be i.i.d. random variables with density (w.r.t. Lebesgue measure)  $f(x) = \frac{1}{\pi} \frac{1}{1+x^2}$ . (So they have the Cauchy distribution.) Find the weak limit (as  $n \rightarrow \infty$ ) of the average

$$\frac{X_1 + \dots + X_n}{n}.$$

*Warning: this is not hard, but also not as trivial as it may seem. Hint: a possible solution is using characteristic functions. Calculating the characteristic function of the Cauchy distribution is a little tricky, but you can look it up.*

5.17 Durrett [1], Exercise 3.4.4

5.18 (**homework**) Durrett [1], Exercise 3.4.5 (*Hint: Use Exercise 4.1 and Durrett [1], Exercise 3.2.14*).
