## Problem Set 3

### The Itô integral, Itô's formula

- 3.1** Let  $s \mapsto v(s)$  be a smooth deterministic function with  $\sup_{0 \leq s \leq T} |v'(s)| \leq C$ . Prove directly from the definition of the Itô integral that

$$\int_0^t v(s)dB(s) = v(t)B(t) - \int_0^t v'(s)B(s)ds.$$

*Hint:* Write

$$v(s_{i+1})B(s_{i+1}) - v(s_i)B(s_i) = v(s_i)(B(s_{i+1}) - B(s_i)) + B(s_{i+1})(v(s_{i+1}) - v(s_i)).$$

- 3.2** Prove directly from the definition of the Itô integral that

$$\int_0^t B(s)dB(s) = \frac{1}{2}B(t)^2 - \frac{t}{2},$$
$$\int_0^t B(s)^2dB(s) = \frac{1}{3}B(t)^3 - \int_0^t B(s)ds.$$

- 3.3** Suppose  $v, w \in \mathcal{V}_T$  and  $C, D \in \mathbb{R}$  are such that

$$\int_0^T v(s)dB(s) + C = \int_0^T w(s)dB(s) + D.$$

Show that  $C = D$  and  $v = w$  ( $s, \omega$ )-almost surely.

- 3.4** (a) For which values of  $\alpha \in \mathbb{R}$  is the process

$$Y_\alpha(t) := \int_0^t (t-s)^{-\alpha}dB(s)$$

well defined as an Itô integral?.

- (b) Compute the covariances  $\mathbf{E}(Y_\alpha(s)Y_\alpha(t))$ .

*Remark:* The process  $t \mapsto Y_\alpha(t)$  is called *fractional Brownian motion*.

**3.5** Use Itô's formula to write the following processes  $t \mapsto X(t)$  in the standard form

$$X(t) = X(0) + \int_0^t u(s)ds + \int_0^t v(s)dB(s).$$

Identify the processes  $s \mapsto u(s)$  and  $s \mapsto v(s)$  under the integrals. Notation:  $B(t)$  denotes standard 1-dimensional Brownian motion,  $(B_1(t), \dots, B_n(t))$  denotes standard  $n$ -dimensional Brownian motion (that is:  $n$  independent standard 1-dimensional Brownian motions).

(a)  $X(t) = B(t)^2$

(b)  $X(t) = 2 + t + e^{B(t)}$

(c)  $X(t) = B_1(t)^2 + B_2(t)^2$

(d)  $X(t) = (t, B(t))$

(e)  $X(t) = (B_1(t) + B_2(t) + B_3(t), B_2(t)^2 - B_1(t)B_3(t))$

**3.6** Use Itô's formula to prove that

$$\int_0^t B(s)^2 dB(s) = \frac{1}{3}B(t)^3 - \int_0^t B(s)ds.$$

**3.7** Suppose  $\theta(t) = (\theta_1(t), \dots, \theta_n(t)) \in \mathbb{R}^n$  with  $t \mapsto \theta_j(t)$ ,  $j = 1, \dots, n$ , progressively measurable and a.s. bounded in any compact interval  $[0, T]$ . Define

$$Z(t) := \exp \left\{ \int_0^t \theta(s)dB(s) - \frac{1}{2} \int_0^t |\theta(s)|^2 ds \right\},$$

where  $t \mapsto B(t)$  is standard Brownian motion in  $\mathbb{R}^n$  and  $|\theta|^2 = \theta_1^2 + \dots + \theta_n^2$ .

(a) Use Itô's formula to prove that

$$dZ(t) = Z(t)\theta(t)dB(t).$$

(b) Deduce that  $t \mapsto Z(t)$  is a martingale.

**3.8** Let  $t \mapsto B(t)$  be a standard 1-dimensional Brownian motion with  $B(0) = 0$ , and

$$\beta_k(t) := \mathbf{E} (B(t)^k).$$

Use Itô's formula to prove that

$$\beta_{k+2}(t) = \frac{1}{2}(k+2)(k+1) \int_0^t \beta_k(s)ds.$$

Compute explicitly  $\beta_k(t)$  for  $k = 0, 1, 2, \dots, 6$ .

**3.9** Let  $t \mapsto B(t)$  be a standard one-dimensional Brownian motion and  $r, \alpha \in \mathbb{R}$  constants. Define

$$X(t) := \exp\{\alpha B(t) + rt\}.$$

Prove that

$$dX(t) = \left(r + \frac{\alpha^2}{2}\right)X(t)dt + \alpha X(t)dB(t).$$

**3.10** Let  $t \mapsto B(t) \in \mathbb{R}^m$  be standard  $m$ -dimensional Brownian motion,  $t \mapsto v(t) \in \mathbb{R}^{n \times m}$  progressively measurable and a.s. bounded. Define

$$X(t) = \int_0^t v(s)dB(s) \in \mathbb{R}^n.$$

Prove that

$$M(t) := |X(t)|^2 - \int_0^t \text{tr}\{v(s)v(s)^T\}ds$$

is a martingale.

**3.11** Use Itô's formula to prove that the following processes are  $(\mathcal{F}_t^B)$ -martingales.

(a)  $X(t) = e^{t/2} \cos B(t)$

(b)  $X(t) = e^{t/2} \sin B(t)$

(c)  $X(t) = (B(t) + t) \exp\{-B(t) - t/2\}$

**3.12** Let  $t \mapsto u(t)$  be progressively measurable and almost surely bounded. Define

$$X(t) := \int_0^t u(s)ds + B(t),$$

$$M(t) := \exp\left\{-\int_0^t u(s)dB(s) - \frac{1}{2}\int_0^t u(s)^2 ds\right\}$$

(Note that according to the statement of problem 7 the process  $t \mapsto M(t)$  is a martingale.) Prove that the process

$$t \mapsto Y(t) := X(t)M(t)$$

is a  $(\mathcal{F}_t^B)$ -martingale.

**3.13** In each of the cases below find a process  $t \mapsto v(t)$  such that  $v \in \mathcal{V}_T$  and the random variable  $X$  is written as

$$X = \mathbf{E}(X) + \int_0^T v(s)dB(s).$$

$$\begin{array}{lll}
(a) & X = B(T), & (b) & X = \int_0^T B(s)ds, & (c) & X = B(T)^2, \\
(d) & B(T)^3, & (e) & e^{B(T)}, & (f) & \sin B(T).
\end{array}$$

**3.14** Let  $x \geq 0$  and define the process

$$X(t) := (x^{1/3} + \frac{1}{3}B(t))^3.$$

Show that

$$dX(t) = \frac{1}{3}\text{sgn}(X(t)) |X(t)|^{1/3} dt + |X(t)|^{2/3} dB(t), \quad X(0) = x.$$

**3.15** Let  $0 = t_0 < t_1 < \dots < t_n = 1$  and let  $\phi_0, \phi_1, \dots, \phi_{n-1}$  be random variables with finite variance. Then the random function  $\psi : [0, 1] \rightarrow \mathbb{R}$  defined as

$$\psi(t) = \sum_{i=1}^n \phi_{i-1} \mathbb{1}_{[t_{i-1}, t_i)}(t) \tag{1}$$

is called *simple*. The stochastic integral of this  $\psi$  is defined as

$$\int_0^1 \psi(t)dB(t) := \sum_{i=1}^n \phi_{i-1}(B(t_i) - B(t_{i-1})).$$

Now let's try to calculate  $\int_0^1 B(t)dB(t)$  by approximating  $B(t)$  with simple functions  $\psi_1, \psi_2, \dots$ : this means that we calculate the  $L^2$  limit

$$I := \lim_{n \rightarrow \infty} \int_0^1 \psi_n(t)dB(t),$$

where  $\psi_n(t) \rightarrow B(t)$ . In this exercise, let's do this with  $\psi_n$  defined as (1) with  $t_i = \frac{i}{n}$  and  $\phi_{i-1} = B(\frac{t_{i-1} + t_i}{2})$ .

a.) Calculate this random variable  $I$ .

(Hint: Let  $X_k = B(\frac{k}{2n}) - B(\frac{k-1}{2n})$ . Then

$$\sum_{i=1}^n \phi_{i-1}(B(t_i) - B(t_{i-1})) = \sum_{i=1}^n B(t_{i-1})(B(t_i) - B(t_{i-1})) + \sum_{i=1}^n X_{2i-1}(X_{2i-1} + X_{2i}).$$

The first sum should be familiar from the lecture. For the second, calculate the expectation and the variance to get the  $L^2$  limit.)

b.) Why is this not equal to the Itô integral  $\int_0^1 B(t)dB(t)$ ?

**3.16** Let  $B(t)$  be a standard Brownian motion and let  $\mathcal{F}_t$  be its natural filtration. Let the random variable  $X$  be  $X = \mathbb{1}_{\{B(1) \geq 0\}}$ . Of course,  $X \in \mathcal{F}_1$ .

a.) For  $0 \leq t \leq 1$  let  $M(t) = \mathbf{E}(X \mid \mathcal{F}_t)$ . Calculate  $M(t)$  explicitly for  $0 \leq t < 1$ .  
*(Hint: since  $X$  is a function of  $B(1)$  and  $B$  is Markov,  $M(t)$  is a function of  $t$  and  $B(t)$ : write it as  $M(t) = f(t, B(t))$  with some function  $f(t, x)$ .)*

b.) Check directly that  $M(t) \rightarrow X$  almost surely as  $t \nearrow 1$ .

c.) Use the Itô formula to check directly that  $M(t)$  is a martingale.

d.) Notice that you just found the Itô representation of  $M(t)$  as well as the Itô representation of:  $X$ : write it as  $X = \mathbf{E}(X) + \int_0^1 v(t)dB(t)$  with an appropriate process  $v$ .

e.) Calculate directly the integral  $V := \int_0^1 \mathbf{E}(v(t)^2) dt$ , and check that the Itô isometry holds.

**3.17** Let  $B(t)$  be a standard Brownian motion and let  $\mathcal{F}_t$  be its natural filtration. Let  $T$  be the time spent by  $B(t)$  on the positive half-line up to  $t = 1$ :

$$T := \text{Leb}(\{s \in [0, 1] \mid B(s) \geq 0\}).$$

We will find the Itô representation of  $T$  – that is, the process  $u(t)$  for which

$$T = \mathbf{E}(T) + \int_0^1 u(t)dB(t).$$

a.) For every  $0 \leq s \leq 1$  let  $X_s = \mathbb{1}_{\{B(s) \geq 0\}}$ . Then  $T = \int_0^1 X_s ds$ . As in the previous exercise, find the martingale  $t \mapsto M_s(t) := \mathbf{E}(X_s \mid \mathcal{F}_t)$ ,  $0 \leq t \leq 1$ . *(Warning: the formula will be different for  $t < s$  and  $t \geq s$ .)*

b.) As in the previous exercise, find the Itô representation

$$X_s = \mathbf{E}(X_s) + \int_0^1 v_s(t)dB(t).$$

*(Warning: you will encounter the integral  $\int_s^1 \frac{1}{\sqrt{t-s}} \varphi\left(\frac{x}{\sqrt{t-s}}\right)$  where  $\varphi$  is the standard normal density function. If you want to use substitution, be careful: the sign of  $x$  matters.)*

c.) Use that  $T = \int_0^1 X_s ds$  to find the Itô representation of  $T$ .

d.) \*\* An alternative way is to use the martingale

$$N(t) := \mathbf{E}(T \mid \mathcal{F}_t) = \int_0^1 \mathbf{E}(X_s \mid \mathcal{F}_t).$$

Calculate  $N(t)$ , use Itô's formula to check that it is really a martingale and find its Itô representation, which is also the Itô representation of  $T$ . Check that you got the same as with the previous method.
