NAME: .... NEPTUN CODE: ....

LECTURER: Dániel Prokaj

Probability Theory 2nd midterm make-up, 10th December 2021.
Working time: 45 minutes. Only simple, non-programmable calculators are allowed.
Maximum score: 24 points, but we consider 20 points already as 100%.

1. In the grocery store, 1 kg of orange costs 500 Ft, and 1 kg of apple costs 600 Ft. I buy a bag of oranges and a bag of apples. The amount of fruits I put in each bag follows a normal distribution with an expected value of 2 kg and a variance of 0.2 kg. We can assume that the weights of the bags are independent. What is the probability that the total cost of the fruits is less than 2000 Ft? (Use the standard normal table on the backside.) (7 points)

2. Let X and Y be independent random variables with uniform distribution on the $[0, 3]$ interval. Let T be the area of the rectangle with side lengths X and Y. Determine the distribution function of T. (6 points)

3. There are 7 mathematicians and 11 physicians attending the same class. The students have to work in 3-member teams on a project exercise that they will present at the end of the semester. The teams are decided by a lot. (That is, I will work with the 2 students whose names I drew.) Let X denote the number of those mathematicians who only have mathematician teammates. $\mathbb{E}[X] =$? (7 points)

Bonus: Calculate the variance of the random variable X from the previous exercise. (4 points)
