## Probability Theory 1 2nd midterm, 8th December 2023. 14:15-15:00

Working time: 45 minutes. Only a simple scientific, non-programmable calculator can be used. *Maximum score (with the bonus exercise): 24 points, but we consider 20 points already as* 100%.

- 1. The shape of a simplified darts board is a circle of radius 5 (suppose that the center of the board is the origin). It is divided as follows: in the middle, there is the bull's eve which is a small circle of radius 1 centered at the same point as the board, and it worths 25 points. The remaining part (which is an annulus) is divided into 20 equal parts such that the x-axis is a borderline, and the parts worth  $1, 2, \ldots, 20$  points respectively arranged counter clockwise beginning from the one which touches the x-axis from above. A player throws a dart with distribution of the pair of the random variables (X, Y), where X and Y have normal distribution N(0, 5), and X and Y are independent.
  - (a) What is the probability that the player hits the bull's eye? (3 points)
  - (b) What is the probability that the player hits the piece worths 20 points? (4 points)
- 2. I usually set up my alarm clock at 7:05. Then my morning preparation takes X minutes, where X is uniformly distributed on the interval [15, 30]. After that my trip from my flat to the university is Y minutes long, where Y is also uniformly distributed on the interval [15, 30]. The time of my preparation and my trip are independent. What is the probability that I arrive before 8:00? (6 points)

Extra: What is the density function of the time of my arrival? (4 points)

- 3. The manufacturing line of the company of Samuel Sung produces 100 televisions per day. Each product is scrap with probability of 0.1 independently. A day is called a sad day if the number of scrap products exceeds 15. The line operates 365 days a year.
  - (a) What is the probability that a day is a sad day? (3 points)
  - (b) What is the probability that there are at least 21 sad days in a year? (4 points)
